Statement on the Use of AI Tools

Final Year Project: **CustomerIQ AI**, a predictive customer intelligence dashboard for e-commerce

Student	[CONFIRM: full name and roll number]
Supervisor	[CONFIRM: supervisor name]
Department / University	[CONFIRM]
Date	[CONFIRM]

1. Tool used

An AI coding assistant, **Claude (by Anthropic), used through Claude Code**, was used during this project. No other generative AI tool is declared here [CONFIRM: add any other tool you used, e.g. ChatGPT, Grammarly].

2. What the AI tool helped with

- **Software:** writing and debugging parts of the web application (Next.js frontend, FastAPI backend, PostgreSQL queries, sign-in and email-verification flow), and the dark user-interface redesign.
- **Deployment help:** step-by-step guidance for hosting on Vercel and Supabase.
- **Report:** drafting the text of the project report, its tables and diagrams, and formatting it.
- **Testing:** writing automated tests and taking screenshots of the running system.

3. What the student did

[CONFIRM and edit each line so it is true for you]

- Chose the project idea, its features and its scope, and decided how it should look and behave.
- Selected the public dataset (Online Retail II, UCI Machine Learning Repository) and imported it into the system.
- Ran, tested and deployed the application, and reported problems for the AI tool to fix.
- Read and checked the report text against the working system [CONFIRM].
- Filled in the details that only the student knows (names, supervisor, dates, personal contribution) [CONFIRM].

4. What is not the AI tool's work

- The dataset (UCI Online Retail II) and all third-party libraries and services, which are cited in the references.
- Published research and methods (for example RFM segmentation and cohort analysis), which are cited and not claimed as original.

5. How the results were checked

- All numbers in the report come from running the system on the dataset. Model scores are reported as measured on held-out data, including the cases where a model was not accurate enough and the system shows "not available".
- The AI tool can make mistakes, so its code and text were run and reviewed rather than accepted blindly [CONFIRM].

6. Declaration

I declare that the information above is accurate, and that I understand and can explain the project's design, code and results.
